

TITLE

TRIACYLGLYCEROL LIPASES

ABSTRACT OF THE DISCLOSURE

This invention relates to an isolated nucleic acid fragment encoding a  
5 triacylglycerol lipase. The invention also relates to the construction of a chimeric  
gene encoding all or a portion of the triacylglycerol lipase, in sense or antisense  
orientation, wherein expression of the chimeric gene results in production of altered  
levels of the triacylglycerol lipase in a transformed host cell.
